ON CERTAIN IDENTITIES INVOLVING FIBONACCI AND LUCAS NUMBERS

M. N. S. Swamy

Concordia University, Montreal, Canada (Submitted January 1996)

In a recent article [3], Jennings established the following three theorems expressing $F_{(2q+1)n}$ as a polynomial in F_n as well as expressing F_{mn}/F_n as a polynomial in L_n , where F_n and L_n are, respectively, the *n*th Fibonacci and Lucas numbers.

Theorem 1:
$$F_{(2q+1)n} = F_n \sum_{k=0}^{q} (-1)^{n(q+k)} \frac{2q+1}{q+k+1} 5^k \binom{q+k+1}{2k+1} F_n^{2k}, \quad n, q \ge 0.$$

Theorem 2: $F_{(2q+1)n} = F_n \sum_{k=0}^{q} (-1)^{(n+1)(q+k)} {q+k \choose 2k} L_n^{2k}, \quad n, q \ge 0.$

Theorem 3: $F_{2qn} = F_n \sum_{k=1}^{q} (-1)^{(n+1)(q+k)} {q+k-1 \choose 2k-1} L_n^{2k-1}, \quad n \ge 0, q \ge 1.$

In a later article [2], Filipponi derived Theorem 1 very simply by letting $X = \alpha^n$, $Y = -\beta^n$, and m = (2q + 1) in Waring's formula, given by

$$X^{m} + Y^{m} = \sum_{k=0}^{[m/2]} (-1)^{k} \frac{m}{m-k} {m-k \choose k} (XY)^{k} (X+Y)^{m-2k}, \quad m \ge 1.$$
(1)

By letting m = 2q in the above formula, he also established the following theorem, which expresses L_{2qn} as a polynomial in F_n .

Theorem 4:
$$L_{2qn} = \sum_{k=0}^{q} (-1)^{n(q+k)} \frac{2q}{q+k} {q+k \choose 2k} 5^k F_n^{2k}, \quad n, q \ge 0.$$

In the same article, Filipponi derived another result by letting $X = \alpha^n$ and $Y = \beta^n$ in the identity given by (1). This result, which expresses L_{mn} in powers of L_n , is given by the following two theorems, wherein the notation of Jennings has been used:

Theorem 5:
$$L_{2qn} = \sum_{k=0}^{q} (-1)^{(n+1)(q+k)} \frac{2q}{q+k} {q+k \choose 2k} L_n^{2k}, \quad n, q \ge 0.$$

Theorem 6: $L_{(2q+1)n} = L_n \sum_{k=0}^{q} (-1)^{(n+1)(q+k)} \frac{2q+1}{q+k+1} {q+k+1 \choose 2k+1} L_n^{2k}, \quad n, q \ge 0.$

In this short article, we will first derive Theorems 2 and 3 of Jennings in a very simple manner by utilizing the following identity, which has been used by Carlitz in 1963 (see [1]) to obtain some results concerning certain Fibonacci arrays:

[AUG.

ON CERTAIN IDENTITIES INVOLVING FIBONACCI AND LUCAS NUMBERS

$$\frac{X^m - Y^m}{X - Y} = \sum_{k=0}^{\lfloor (m-1)/2 \rfloor} (-1)^k \binom{m-k-1}{k} (XY)^k (X+Y)^{m-2k-1}, \quad m \ge 1.$$
(2)

Using this identity, we will establish two other theorems that express $L_{(2q+1)n} / L_n$ and F_{2qn} / L_n in powers of F_n .

Now, letting $X = \alpha^n$ and $Y = \beta^n$ in identity (2), we obtain $X + Y = \alpha^n + \beta^n = L_n$ and $XY = (\alpha\beta)^n = (-1)^n$. Thus, we have

$$\alpha^{mn} - \beta^{mn} = (\alpha^m - \beta^m) \sum_{k=0}^{[(m-1)/2]} (-1)^k \binom{m-k-1}{k} (-1)^{nk} L_n^{m-2k-1}, \quad n \ge 0, m \ge 1$$

or

$$F_{mn} = F_n \sum_{k=0}^{\left[(m-1)/2\right]} (-1)^{(n+1)k} \binom{m-k-1}{k} L_n^{m-2k-1}, \quad n \ge 0, m \ge 1.$$
(3)

Setting m = 2q + 1,

$$F_{(2q+1)n} = F_n \sum_{k=0}^{q} (-1)^{(n+1)k} {\binom{2q-k}{k}} L_n^{2q-2k}, \quad n, q \ge 0.$$

Changing k to q-k, we may rewrite the above as

$$F_{(2q+1)n} = F_n \sum_{k=0}^{q} (-1)^{(n+1)(q+k)} {q+k \choose 2k} L_n^{2k}, \quad n, q \ge 0,$$

which proves Theorem 2. Similarly, by setting m = 2q in (3), we establish Theorem 3.

We now state and prove the following two new theorems.

Theorem 7: $F_{2qn} = F_n L_n \sum_{k=0}^{q-1} (-1)^{n(q+k+1)} {q+k \choose 2k+1} 5^k F_n^{2k}, \quad n, q \ge 0.$

Proof: Let $X = \alpha^n$, $Y = -\beta^n$, and m = 2q in (2). Then we have $X + Y = \alpha^n - \beta^n = \sqrt{5} F_n$, $XY = -(\alpha\beta)^n = (-1)^{n+1}$, and

$$\alpha^{2qn} - \beta^{2qn} = (\alpha^n + \beta^n) \sum_{k=0}^{q-1} (-1)^k \binom{2q-k-1}{k} (-1)^{(n+1)k} 5^{(2q-2k-1)/2} F_n^{2q-2k-1}, \quad n, q \ge 0.$$

Thus

$$F_{2qn} = L_n \sum_{k=0}^{q-1} (-1)^{nk} \binom{2q-k-1}{k} 5^{q-k-1} F_n^{2q-2k-1}, \quad n, q \ge 0.$$

Changing k to q-1-k, we may rewrite the above as

$$F_{2qn} = F_n L_n \sum_{k=0}^{q-1} (-1)^{n(q+k+1)} {q+k \choose 2k+1} 5^k F_n^{2k}, \quad n, q \ge 0,$$

and hence the theorem.

Theorem 8:
$$L_{(2q+1)n} = L_n \sum_{k=0}^q (-1)^{n(q+k)} {q+k \choose 2k} 5^k F_n^{2k}, \quad n, q \ge 0.$$

1997]

This theorem may be established by letting $X = \alpha^n$, $Y = -\beta^n$, and m = (2q+1) in (2), and following the same steps used to prove Theorem 7.

Finally, it may be mentioned that similar results can be established for the Pell and Pell-Lucas numbers P_n and Q_n using the identities given in (1) and (2).

CALL FOR PAPERS

Papers on all branches of mathematics and science related to the Fibonacci numbers, number theoretic facts as well as recurrences and their generalizations are welcome. The first page of the manuscript should contain only the title, name, and address of each author, and an abstract. Abstracts and manuscripts should be sent in duplicate by May 1, 1998, following the guidelines for submission of articles found on the inside front cover of any recent issue of *The Fibonacci Quarterly* to:

PROFESSOR F. T. HOWARD, Organizer Box 117, 1959 North Peace Haven Road Winston-Salem, NC 27106 e-mail: howard@mthcsc.wfu.edu
