

ACSC/STAT 3720, Life Contingencies I

Winter 2015

Toby Kenney

Homework Sheet 6

Due: Friday 20th March: 10:30 PM

Basic Questions

1. An insurer issues 5,000 whole life insurance policies to select lives aged 51. The appropriate interest rate is $i = 0.06$. The company calculates $A_{[51]} = 0.111865$ and ${}^2A_{[51]} = 0.0276334$. If the death benefit is \$350,000, what annual premium should the company charge using the portfolio percentile method with a 98% probability of making a profit?
2. Using the lifetable in Table 1, and interest rate $i = 0.05$, calculate the net annual premium for a 5-year term insurance policy with Death benefit \$250,000, sold to a select life aged 32, if:
 - (a) The life is an impaired life, and is treated as being 8 years older than she is [but is still treated as being select at the start of the policy].
 - (b) The life works in a hazardous environment, and has mortality 0.008 higher than normal.
3. An insurance company has a whole life insurance policy for a select individual aged 39. The death benefit of this policy is \$800,000, and the interest rate is $i = 0.07$. Premiums are payable until age 80. The insurance company calculates $A_{[39]} = 0.0423697$, and $A_{[39]+41} = 0.353734$. Therefore, the net annual premium for the policy is \$2,361.64. What is the policy value if the life survives to age 75? [Use the lifetable in Table 1. $A_{[39]+36} = 0.286183$.]

Standard Questions

4. For the individual in Question 3, what is the policy value at age 75 if the individual is found to be select at age 75? [All other assumptions remain the same.]
5. For the individual in Question 3, what is the policy value at age 75 if the interest rate has increased to $i = 0.09$? [All other assumptions remain the same as in Question 3. At this interest rate, we have $A_{80} = 0.281157$ and $A_{75} = 0.218262$.]
6. A select life aged 48 takes out a 5-year endowment insurance with benefit \$600,000. The initial cost of this insurance is \$1000 plus 30% of the first annual premium. The renewal cost is 2% of each subsequent premium. The interest rate is $i = 0.04$. Using the lifetable in Table 1, we can calculate $A_{[48]:\bar{5}} = 0.8221934$.
 - (a) Calculate the gross premium for this policy.
 - (b) Calculate the gross policy value after 2 years.

Bonus Questions

7. An insurance company wants to develop a new policy with a variable death benefit, designed so that if the policy basis does not change, then the net policy value is 0 at all future times. Assuming the policy has a constant annual premium, what should the death benefit be if the policyholder dies in the n th year of the policy?

Table 1: Select lifetable to be used for questions on this assignment
