

ACSC/STAT 3720, Life Contingencies I  
Winter 2018  
Toby Kenney  
Homework Sheet 1  
Due: Friday 26th January: 12:30 PM

### Basic Questions

1. An insurance company models the future lifetime of an individual as having survival function  $S(x) = e^{-\left(\frac{x}{85}\right)^3}$ . Calculate the force of mortality.
2. An insurance company models the future lifetime of an individual as having survival function  $S(x) = e^{-\frac{x^2}{360}}$ . Calculate:
  - (a) The mean and standard deviation of  $T_x$ .
  - (b) The mean curtate future lifetime.
3. An insurance company uses a survival model with survival function  ${}_t p_x = \left(1 - \frac{t}{120-x}\right)^\alpha$ . The company wants to ensure that under this model, an individual aged 60 has probability 0.5 of surviving for 20 years. What value of  $\alpha$  should they choose?
4. An insurance company uses a survival model given by

$$S_0(x) = \frac{1}{3} \left(1 - \frac{x}{105}\right)^{\frac{1}{4}} + \frac{2}{3} \left(1 - \frac{x}{120}\right)^{\frac{1}{3}}$$

Using this model, prepare a life table for the ages from 40 to 45, using radix 10,000.

5. Using the lifetable:

| $x$ | $l_x$    | $d_x$ |
|-----|----------|-------|
| 35  | 10000.00 | 3.91  |
| 36  | 9996.09  | 4.37  |
| 37  | 9991.72  | 4.91  |
| 38  | 9986.81  | 5.52  |
| 39  | 9981.30  | 6.21  |
| 40  | 9975.09  | 7.00  |

calculate the probability that an individual aged 36 years and five months survives another 3 years, using:

- (a) the uniform distribution of deaths assumption.
- (b) the constant force of mortality assumption.

## Standard Questions

6. An insurance company wants to use a model of mortality of the form  $\mu_x = \frac{a}{120-x} + \frac{1}{m-x}$  for  $x < 120$ . The company wants to ensure that the life expectancy for an individual aged 65 is 15 years and that the force of mortality at age 45 is  $\mu_{65} = \frac{1}{44}$ . What values of  $a$  and  $m$  should they use to match these values.
7. An insurance company prepares the following lifetable for an individual.

| $x$ | $l_x$    | $d_x$  |
|-----|----------|--------|
| 40  | 10000.00 | 51.16  |
| 41  | 9948.84  | 59.96  |
| 42  | 9888.87  | 70.24  |
| 43  | 9818.64  | 82.19  |
| 44  | 9736.44  | 96.08  |
| 45  | 9640.36  | 112.16 |
| 46  | 9528.20  | 130.72 |
| 47  | 9397.48  | 152.04 |
| 48  | 9245.44  | 176.41 |
| 49  | 9069.03  | 204.11 |
| 50  | 8864.92  | 235.34 |

Prepare a new life table for this individual over the age range 45–50 using radix 10,000.
