# ACSC/STAT 4703, Actuarial Models II Fall 2022 <br> Toby Kenney <br> Sample Final Examination 

This Sample examination has more questions than the actual final, in order to cover a wider range of questions. Estimated times are provided after each question to help your preparation.

1. An insurance company sells home insurance. It estimates that the standard deviation of the aggregate annual claim is $\$ 5,326$ and the mean is $\$ 1,804$.
(a) How many years history are needed for an individual or group to be assigned full credibility? (Use $r=0.05$, $p=0.95$.) [5 mins.]
(b) What is the Credibility premium, using limited fluctuation credibility, for an individual who has claimed a total of $\$ 42,381$ in the past 19 years? [ 5 mins.]
2. For a car insurance policy, the book premium for claim severity is $\$ 2,300$. An individual has made 7 claims in the past 12 years, with average claim severity $\$ 1,074$. Calculate the credibility estimate for claim severity for this individual using limited fluctuation credibility, if the standard for full credibility is:
(a) 157 claims. [5 mins.]
(b) 284 years. [5 mins.]
3. A worker's compensation insurance company classifies workplaces as "safe" or "hazardous". Claims from hazardous workplaces follow a Gamma distribution with $\alpha=0.1021749, \theta=1066798$ (mean $\$ 109,000$ and standard deviation $\$ 341,000$ ). Claims from safe workplaces follow a Gamma distribution with $\alpha=0.01209244, \theta=2646281$ (mean $\$ 32,000$ and standard deviation $\$ 261,000$ ). $94 \%$ of workplaces are classified as safe.
[You may need the following values:

$$
\begin{aligned}
\Gamma(0.01209244) & =82.13091 \\
\Gamma(0.1021749) & =9.302457
\end{aligned}
$$

(a) Calculate the expectation and variance of claim size for a claim from a randomly chosen workplace. [5 mins.]
(b) The last 2 claims from a particular workplace are $\$ 488,200$ and $\$ 17,400$. Calculate the expectation and variance for the next claim size from this workplace. [10 mins.]
4. An insurance company sets the book pure premium for its home insurance at $\$ 791$. The expected process variance is $6,362,000$ and the variance of hypothetical means is 341,200 . If an individual has no claims over the last 8 years, calculate the credibility premium for this individual's next year's insurance using the Bühlmann model. [5 mins.]
5. An insurance company is reviewing the premium for an individual with the following past claim history:

| Year | 1 | 2 | 3 | 4 | 5 |
| :--- | :--- | :--- | :--- | :--- | :--- |
| Exposure | 0.2 | 1 | 1 | 0.4 | 0.8 |
| Aggregate claims | 0 | $\$ 2,592$ | 0 | $\$ 147$ | $\$ 1,320$ |

The usual premium per unit of exposure is $\$ 2,700$. The expected process variance is 123045 and the variance of hypothetical means is 36403 (both per unit of exposure). Calculate the credibility premium for this individual if she has 0.6 units of exposure in year 6. [10 mins.]
6. An insurance company has 3 years of past history on a homeowner, denoted $X_{1}, X_{2}, X_{3}$. Because the individual moved house at the end of the second year, the third year has a different mean and variance, and is not as correlated with the other two years. It has the following

$$
\begin{aligned}
\mathbb{E}\left(X_{1}\right) & =1,322 & \operatorname{Var}\left(X_{1}\right) & =226,000 \\
\mathbb{E}\left(X_{2}\right) & =1,322 & \operatorname{Var}\left(X_{2}\right) & =226,000 \\
\mathbb{E}\left(X_{3}\right) & =4,081 & \operatorname{Var}\left(X_{3}\right) & =1,108,000 \\
\mathbb{E}\left(X_{4}\right) & =4,081 & \operatorname{Var}\left(X_{4}\right) & =1,108,000 \\
\operatorname{Cov}\left(X_{1}, X_{2}\right) & =214 & \operatorname{Cov}\left(X_{1}, X_{3}\right) & =181 \\
\operatorname{Cov}\left(X_{2}, X_{3}\right) & =181 & \operatorname{Cov}\left(X_{1}, X_{4}\right) & =181 \\
\operatorname{Cov}\left(X_{2}, X_{4}\right) & =181 & \operatorname{Cov}\left(X_{3}, X_{4}\right) & =861
\end{aligned}
$$

It uses a formula $\hat{X}_{4}=\alpha_{0}+\alpha_{1} X_{1}+\alpha_{2} X_{2}+\alpha_{3} X_{3}$ to calculate the credibility premium in the fourth year. Calculate the values of $\alpha_{0}, \alpha_{1}, \alpha_{2}$ and $\alpha_{3}$. [15 mins.]
7. An insurance company has the following previous data on aggregate claims:

| Policyholder | Year 1 | Year 2 | Year 3 | Year 4 | Mean | Variance |
| :--- | ---: | ---: | ---: | ---: | ---: | ---: |
| 1 | 1,210 | 246 | 459 | 1,461 | 944.00 | 340158.00 |
| 2 | 0 | 0 | 0 | 0 | 0.00 | 0.00 |
| 3 | 0 | 2,185 | 0 | 0 | 548.25 | 1202312.25 |
| 4 | 809 | 0 | 0 | 1,725 | 633.50 | 674939.00 |
| 5 | 0 | 0 | 0 | 0 | 0.00 | 0.00 |

Calculate the Bühlmann credibility premium for policyholder 3 in Year 5. [15 mins.]
8. An insurance company collects the following claim frequency data for 7,000 customers insured for the past 3 years:

| No. of claims | Frequency |
| :--- | ---: |
| 0 | 1,492 |
| 1 | 2,460 |
| 2 | 1,810 |
| 3 | 827 |
| 4 | 302 |
| 5 | 72 |
| 6 | 31 |
| 7 | 3 |
| 8 | 1 |
| $>8$ | 0 |

It assumes that the number of claims an individual makes in a year follows a Poisson distribution with parameter $\Lambda$, which may vary between individuals.
Find the credibility estimate for the expected number of claims per year for an individual who has made 4 claims in the past 3 years. [ 15 mins .]
9. An insurance company starts a new line of insurance in 2016 , and collects a total of $\$ 1,900,000$ in premiums that year, and the estimated incurred losses for accident year 2016 are $\$ 1,384,000$. Half of the premium payments are made at the beginning of the year, and the other half are uniformly distributed over the year. An actuary is using this data to estimate rates for premium year 2018. Claims are subject to $4 \%$ inflation per year. By what percentage should premiums increase from 2016 in order to achieve a loss ratio of 0.75 ? [ 15 mins ]
10. An insurer classifies policies into three classes - single, couple and family. The experience from policy year 2016 is:

| Class | Current differential | Earned premiums | Loss payments |
| :--- | :--- | :--- | :--- |
| Single | 0.74 | 4,740 | 3,940 |
| Couple | 0.93 | 4,490 | 3,880 |
| Family | 1 | 5,670 | 4,930 |

The base premium was $\$ 420$. Claim amounts are subject to $4 \%$ annual inflation. If the expense ratio is $25 \%$, calculate the new premiums for each age class for policy year 2018. [ 15 mins ]
11. An insurer has different premiums for personal and commercial vehicles. Its experience for accident year 2016 is given below. There was a rate change on 1st August 2015, which affects some policies in 2016.

| Type | Differential before <br> rate change | Current <br> differential | Earned <br> premiums | Loss <br> payments |
| :--- | :--- | :--- | :--- | :--- |
| Personal | 1 | 1 | 11,300 | 9,800 |
| Commercial | 1.51 | 1.67 | 7,600 | 6,300 |

Before the rate change, the base premium was $\$ 950$. The current base premium is $\$ 1,020$. Assuming that policies were sold uniformly over the year, calculate the new premimums for policy year 2018 assuming $6 \%$ annual inflation and a permissible loss ratio of 0.75 . [ 15 mins ]
12. An insurance company has the following data for accident year 2017:

| Earned Premiums |  |  |  | Loss Payments |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | House | Appartment | House | Appartment |
| Differential |  | 1 | 0.88 | 1 | 0.88 |
| Halifax | 1 | 5,200 | 4,100 | 4,150 | 3,600 |
| Dartmouth | 0.84 | 3,700 | 2,900 | 2,080 | 2,430 |
| Bedford | 1.25 | 4,400 | 2,500 | 3,820 | 2,030 |

The base premium in 2017 was $\$ 840$. Calculate new premiums for policy year 2018 using inflation of $3 \%$ per year and expense ratio of 0.2 .
13. An insurance company is calculating the premium for a new line of insurance it started in 2018. The new line of insurance started on 1st May 2018, and half of the policies started at that time. Due to an advertising campaign, the rate of policy purchases in November and December was twice the rate for the months from May to October. The annual premium in 2018 was $\$ 600$. The total premiums collected in 2018 were $\$ 1,200,000$ and the total losses were $\$ 462,000$. Assuming losses are uniformly distributed throughout the year, annual inflation is $5 \%$, and the expense ratio is 0.2 , calculate the new premium for policy year 2020 .
14. An insurance company has the following data on its policies:

| Policy limit | Losses Limited to |  |  |  |  |
| ---: | ---: | ---: | ---: | ---: | :---: |
|  | 20,000 | 50,000 | 100,000 | 500,000 |  |
| 20,000 | $1,400,000$ |  |  |  |  |
| 50,000 | $7,540,000$ | $8,010,000$ |  |  |  |
| 100,000 | $22,600,000$ | $24,100,000$ | $28,700,000$ |  |  |
| 500,000 | $5,900,000$ | $6,220,000$ | $6,650,000$ | $6,920,000$ |  |

Use this data to calculate the ILF from $\$ 20,000$ to $\$ 500,000$ using
(a) The direct ILF estimate. [5 mins]
(b) The incremental method. [5 mins]
15. For a certain line of insurance, the loss amount per claim follows a Pareto distribution with $\alpha=4$. If the policy has a deductible per loss set at $0.1 \theta$ and a policy limit set at $2 \theta$, by how much will the expected payment per loss increase if there is inflation of $5 \%$ ? [ 10 mins ]
16. An insurance company charges a risk charge equal to the square of the average loss amount, divided by 100,000 . It has the following data on a set of 1,200 claims from policies with limit $\$ 1,000,000$.

| Losses Limited to | 50,000 | 100,000 | 500,000 | $1,000,000$ |
| ---: | ---: | ---: | ---: | ---: |
| Total claimed | $16,700,000$ | $20,880,000$ | $27,030,000$ | $32,410,000$ |

Calculate the ILF from $\$ 100,000$ to $\$ 1,000,000$. [10 mins]
17. An insurer calculates the ILF on the pure premium from $\$ 1,000,000$ to $\$ 2,000,000$ on a particular policy is 1.092 . A reinsurer offers excess-of-loss reinsurance of $\$ 1,000,000$ over $\$ 1,000,000$ for a loading of $30 \%$. The original insurer uses a loading of $20 \%$ on policies with limit $\$ 1,000,000$. If the insurer buys the excess-of-loss reinsurance, what is the loading on its premium for policies with a limit of $\$ 2,000,000$ ? [ 10 mins ]
