## **GENERALIZED EULERIAN NUMERALS AND POLYNOMIALS**

and (5.3)

$$0 = \sum_{k=n}^{2n} (-1)^k \sum_{j=0}^{k-n} {n \choose j} {n-j \choose 2n-k} A_{n+j,k} .$$

In view of the combinatorial interpretation of  $A_{n,k}$  and  $G_{n,m}$ , (5.2) implies a combinatorial result; however the result in question is too complicated to be of much interest.

For p = 3, consider

$$6^{n}x \frac{G_{n}^{(3)}(x)}{(1-x)^{3n+1}} = \sum_{k=0}^{\infty} k^{n}(k^{2}-1)^{n}x^{k} = \sum_{j=0}^{n} (-1)^{n-j} {n \choose j} \sum_{k=0}^{\infty} k^{n+2j}x^{k} = \sum_{j=0}^{n} (-1)^{n-j} {n \choose j} \frac{A_{n+2j}(x)}{(1-x)^{n+2j+1}}$$

Thus we have

(5.4) 
$$6^n x G_n^{(3)}(x) = \sum_{j=0}^n (-1)^{n-j} {n \choose j} (1-x)^{2n-2j} A_{n+2j}(x)$$

The right-hand side of (5.4) is equal to

$$\sum_{j=0}^{n} (-1)^{n-j} {n \choose j} \sum_{s=0}^{2n-2j} (-1)^{s} {2n-2j \choose s} x^{s} \sum_{k=1}^{n+2j} A_{n+2j,k} x^{k} = \sum_{m=1}^{3n} x^{m} \sum_{j=0}^{n} (-1)^{n-j} {n \choose j} \sum_{k=1}^{n+2j} (-1)^{m-k} {2n-2j \choose m-k} A_{n+2j,k} x^{k} = \sum_{m=1}^{3n} x^{m} \sum_{j=0}^{n} (-1)^{n-j} {n \choose j} \sum_{k=1}^{n+2j} (-1)^{m-k} {2n-2j \choose m-k} A_{n+2j,k} x^{k} = \sum_{m=1}^{3n} x^{m} \sum_{j=0}^{n} (-1)^{n-j} {n \choose j} \sum_{k=1}^{n-2j} (-1)^{n-k} {2n-2j \choose m-k} A_{n+2j,k} x^{k} = \sum_{m=1}^{3n} x^{m} \sum_{j=0}^{n} (-1)^{n-j} {n \choose j} \sum_{k=1}^{n-2j} (-1)^{n-k} {2n-2j \choose m-k} A_{n+2j,k} x^{k} = \sum_{m=1}^{3n} x^{m} \sum_{j=0}^{n-2j} (-1)^{n-j} {n \choose j} \sum_{k=1}^{n-2j} (-1)^{n-k} {2n-2j \choose m-k} A_{n+2j,k} x^{k} = \sum_{m=1}^{3n} x^{m} \sum_{j=0}^{n-2j} (-1)^{n-j} {n \choose j} \sum_{k=1}^{n-2j} (-1)^{n-k} {2n-2j \choose m-k} A_{n+2j,k} x^{k} = \sum_{m=1}^{3n} x^{m} \sum_{j=0}^{n-2j} (-1)^{n-j} {n \choose j} \sum_{k=1}^{n-2j} (-1)^{n-k} {2n-2j \choose m-k} A_{n+2j,k} x^{k} = \sum_{m=1}^{3n} x^{m} \sum_{j=0}^{n-2j} (-1)^{n-j} {n \choose j} \sum_{k=1}^{n-2j} (-1)^{n-k} {2n-2j \choose m-k} A_{n+2j,k} x^{k} = \sum_{m=1}^{3n} x^{m} \sum_{j=0}^{n-2j} (-1)^{n-j} {n \choose j} \sum_{k=1}^{n-2j} (-1)^{n-k} {2n-2j \choose m-k} A_{n+2j,k} x^{k} = \sum_{m=1}^{3n} x^{m} \sum_{j=0}^{n-2j} (-1)^{n-j} {n \choose j} \sum_{k=1}^{n-2j} (-1)^{n-k} {2n-2j \choose m-k} x^{m-2j} = \sum_{m=1}^{n-2j} x^{m-2j} = \sum_{m$$

It follows that

(5.5) 
$$\tilde{\mathbf{6}}^{n} \mathbf{G}_{n,m-1}^{(3)} = \sum_{j=0}^{n} (-1)^{n-j} {n \choose j} \sum_{k=1}^{n+2j} (-1)^{m-k} {2n-2k \choose m-k} \mathbf{A}_{n+2j,k}$$

## \*\*\*\*\*\*\*

[Continued from page 129.]

Recalling [2, p. 137] that

$$(j+1) \sum_{k=1}^{n} k^{j} = B_{j+1}(n+1) - B_{j+1}$$

where  $B_j(x)$  are Bernoulli polynomials with  $B_j(0) = B_j$ , the Bernoulli numbers, we obtain from (2.3) with x = 1, B = 11, and  $\vec{C}_k = k$  the inequality

(2.4) 
$$B_{2p}(n+1) - B_{2p} \le (B_p(n+1) - B_p)^2$$
  $(n = 1, 2, ...)$ .  
For  $p = 2k + 1$ ,  $k = 1, 2, ..., B_{2k+1} = 0$ , and so (2.4) gives the inequality

$$= 2k + 1, k = 1, 2, \dots, B_{2k+1} = 0$$
, and so (2.4) gives the inequality  
 $B_{4k+2}(n+1) - B_{4k+2} \le B_{2k+1}^2(n+1)$   $(n,k = 1, 2, \dots)$ .
