MATH/STAT 3460, Intermediate Statistical Theory Winter 2014 Toby Kenney In Class Examples

#### Question

We purchase a bag of a new type of candy, that comes in different colours. Of the first 10 sweets we take out of the bag, 3 are red, 2 are blue, 2 are green, 1 is brown, 1 is purple, and 1 is white. If we assume all colours are equally likely, what is the maximum likelihood estimate for the number of colours?

#### Question

You toss a coin 100 times, and get 37 heads. What is the maximum likelihood estimator for the probability of getting heads?

### Question

A team of ecologists wants to know how many of a certain species of birds lives in a forest. They perform the following experiment: They capture a group of birds and mark them. They then release the birds, and capture more birds a week later, and count how many of those are marked.

Suppose the first group captured (and marked) contains 124 birds, and the second group contains 138 birds, of which 17 are marked. What is the maximum likelihood estimator for the number of birds in the forest?

#### Question

Let  $X_1, \ldots, X_n$  be samples from a binomial distribution B(10, p). What is the maximum likelihood estimator for p?

< □ > < 同 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □

### Question

You are conducting a survey. One of the questions is potentially sensitive — the answer "YES" might be embarassing. To avoid embarrassment, you attempt one of the following schemes:

- Ask the participant to roll a die (out of sight) and if it is 6, answer "YES" regardless of the true answer.
- Ask the participant to roll a die (out of sight) and if it is 6, give the opposite of the true answer.

What is the maximum likelihood estimate for the number of people who should really answer "YES" in each case?

#### Question

The lifetime of a light-bulb is thought to be exponentially distributed with parameter  $\lambda$ . 1000 light bulbs are left on for 24 hours. Within that time 8 of them break. What is the maximum likelihood estimate for  $\lambda$ ?

. . . . . . .

# **Combining Independent Events**

#### Question

The lifetime of a light-bulb is thought to be exponentially distributed with parameter  $\lambda$ . 1000 light bulbs are left on for 24 hours. Within that time 8 of them break. Another set of 500 light bulbs are left on for 72 hours. Within that time 14 of them break. What is the maximum likelihood estimate for  $\lambda$  from the combined data?

# **Combining Independent Events**

#### Question

Two people are conducting a survey with a potentially sensitive question. One of them uses technique 1 and gets 43 "YES" answers out of 200. The other uses technique 2 and gets 20 "YES" answers out of 100. What are their individual MLEs and what is the combined MLE?

# **Relative Likelihood**

#### Question

You toss a coin 100 times, and get 37 heads.

(a) What is the relative likelihood that the probability of getting heads on a single roll is 0.5?

(b) Find a 10% likelihood interval for the probability.

▲ @ ▶ ▲ ■ ▶ ▲ ■

# **Relative Likelihood**

### Question

The lifetime of a light-bulb is thought to be exponentially distributed with parameter  $\lambda$ . 1000 light bulbs are left on for 24 hours. Within that time 8 of them break. Find a 5% likelihood interval for  $\lambda$ .

A > + = + + =

#### Question

Let  $X_1, \ldots, X_n$  be uniformly distributed on the interval [0, a] for some unknown a. What is the maximum likelihood estimate for a?

<回とくほとくほ

#### Question

Let  $X_1, \ldots, X_n$  be normally distributed with mean  $\mu$  and variance 1. What is the maximum likelihood estimate for  $\mu$ ?

#### Question

Let  $X_1, \ldots, X_n$  be normally distributed with mean 0 and variance  $\sigma^2$ . What is the maximum likelihood estimate for  $\sigma$ ?

A (10) A (10) A (10)

#### Question

Let  $X_1, \ldots, X_n$  be exponentially distributed with parameter  $\lambda$ . What is the maximum likelihood estimate for  $\lambda$ ?

### Question

We take two samples from a normal distribution with unknown mean  $\mu$  and variance 1. The first sample has 30 observations, and has mean 2.86. The second sample has 23 observations and has mean 3.11. What is the maximum likelihood estimate of  $\mu$  from the combined data set.

## Censoring in Lifetime Experiments

### Question

Let  $X_1, \ldots, X_n$  be exponentially distributed with parameter  $\lambda$ . However, the values are censored above 1, so for any  $X_i > 1$ , we do not know the value of  $X_i$ , only that it is at least 1. What is the maximum likelihood estimate of  $\lambda$ ?

# Censoring in Lifetime Experiments

### Question

A company is interested in how frequently customers visit its website. When a customer visits the website, it leaves a unique cookie in the user's browser. When the user returns, it records the time since the cookie was issued. It records the following times (in days)

| Days               | 1  | 2  | 3  | 4  | 5  | 6  | 7  |
|--------------------|----|----|----|----|----|----|----|
| Frequency Returned | 10 | 25 | 31 | 45 | 53 | 49 | 51 |
| Frequency Censored | 8  | 15 | 18 | 30 | 33 | 34 | 31 |
| Days               | 8  | 9  | 10 | 11 | 12 | 13 | 14 |
| Frequency Returned | 33 | 29 | 18 | 21 | 13 | 8  | 6  |
| Frequency Censored | 27 | 29 | 36 | 35 | 31 | 38 | 29 |

Assume that the number of days until a customer returns has a geometric distribution with probability p. What is the maximum likelihood estimate for p?

# Invariance

### Question

Under a certain model of evolution, for two species with phylogenetic distance *t* between them, the probability that a given nucleotides will be the same is  $\frac{1}{4} + \frac{3}{4}e^{-\frac{4}{3}t}$ . If for two given species, and a given gene, there are 532 nucleotides, of which, 346 are the same between the two species.

(a) What is the maximum likelihood estimate of the phylogenetic distance between them?

(b) Find a 10% likelihood interval for the phylogenetic distance between them.

## Invariance

#### Question

The lifetime of a light-bulb is thought to be exponentially distributed with parameter  $\lambda$ . 1000 light bulbs are left on for 24 hours. Within that time 8 of them break. What is the maximum likelihood estimate for the mean lifetime of a lightbulb?

# Invariance

#### Question

Suppose the number of car accidents on a typical day has a Poisson distribution with mean  $\lambda$ . The average time between car accidents is  $\frac{1}{\lambda}$ . Suppose we observe 234 car accidents over a period of 44 typical days. Calculate the MLE and a 10% likelihood interval for the average time between car accidents.

### Question

We toss a coin 100 times, and get heads 37 times. Use the normal approximation to estimate a 10% likelihood interval for the probability of heads.

A (1) > A (2) > A

### Question

Let  $X_1, \ldots, X_n$  be independent sample from a uniform distribution on  $[0, \theta]$ . How large does *n* have to be for us to use a normal approximation to the likelihood function?

A > + = + + =

#### Question

Let  $X_1, \ldots, X_n$  be independent samples from an exponential distribution with parameter  $\lambda$ . Suppose n = 300 and  $X_1 + \cdots + X_n = 824$ . Find a 10% likelihood interval for  $\lambda$  using a normal approximation, and compare it with the true 10% likelihood interval.

### Question

Let  $X_1, \ldots, X_n$  be independent samples from an exponential distribution with parameter  $\lambda$ . Suppose n = 300 and  $X_1 + \cdots + X_n = 824$ . Find a 10% likelihood interval for  $\lambda$  using a normal approximation to a suitable transformation of  $\lambda$ , and compare it with the true 10% likelihood interval.

# Newton's Method

### Question

Let  $X_1, X_2, X_3$  be independent samples whose distribution is that of a sum of two independent exponential distributions with parameters  $\lambda$  and  $2\lambda$ . That is,

$$f_{X_i}(x) = 2\lambda(e^{-\lambda x} - e^{-2\lambda x})$$

Find the maximum likelihood estimate for  $\lambda$  if  $X_1 = 2$ ,  $X_2 = 3.1$  and  $X_3 = 1.5$ .

### Question

Let  $X_1, \ldots, X_n$  be independent samples from a normal distribution with mean  $\mu$  and variance  $\sigma^2$ , where  $\mu$  and  $\sigma$  are unknown. What is the maximum likelihood estimate for the pair  $(\mu, \sigma)$ ?

### Question

Let  $X_1 = 4, X_2 = 7, X_3 = 5$  be independent samples from a binomial distribution, with parameters *n* and *p*. What is the maximum likelihood estimate of *n* and *p*?

### Question

We roll a die 100 times, and get 18 sixes. In another experiment, we roll the same die 100 times and get 19 fives. What is the maximum likelihood estimate for the probabilities of getting a six, and getting a five?

#### Question

Let  $X_i = A_i + B_i$ , where  $A_i$  are uniformly distributed on [1, a] and  $B_i$  are uniformly distributed on [0, b]. Find the maximum likelihood estimate for *a* and *b* from the  $X_i$ , if the data are  $X_1 = 1.3$ ,  $X_2 = 1.9$ ,  $X_3 = 2.3$  and  $X_4 = 3.4$ . (The values of  $A_i$  and  $B_i$  are unobserved.)

### Question

Let  $X_1, \ldots, X_n$  be independent samples from a normal distribution with mean  $\mu$  and variance  $\sigma^2$ , where  $\mu$  and  $\sigma$  are unknown. Suppose the mean of  $X_1, \ldots, X_n$  is 2.3 and the sample variance  $\frac{1}{n} \sum_{i=1}^n (X_i - 2.3)^2$  is 6.76.

(a) Find the relative likelihood function for  $\mu$  and  $\sigma$ .

(b) Find a 10% likelihood region for  $\mu$  and  $\sigma$ .

## **Relative Likelihood and Contour Maps**

#### Question

Let  $X_1 = 4, X_2 = 7, X_3 = 5$  be independent samples from a binomial distribution, with parameters *n* and *p*. (a) What is the relative likelihood function for *n* and *p*? (b) Find a 1% likelihood region for *n* and *p*.

### Question

Let  $X_1, \ldots, X_n$  be independent samples from a normal distribution with mean  $\mu$  and variance  $\sigma^2$ , where  $\mu$  and  $\sigma$  are unknown. Suppose the mean of  $X_1, \ldots, X_n$  is 2.3 and the sample variance  $\frac{1}{n} \sum_{i=1}^n (X_i - 2.3)^2$  is 6.76. Calculate the maximum relative likelihood function of (a)  $\sigma$ . (b)  $\mu$ .

## Maximum Relative Likelihood

### Question

Let  $X_1 = 4, X_2 = 7, X_3 = 5$  be independent samples from a binomial distribution, with parameters *n* and *p*. What is the maximum relative likelihood function for *n*?

A (10) A (10) A (10)

## Maximum Relative Likelihood

#### Question

Let  $X_i = A_i + B_i$ , where  $A_i$  are uniformly distributed on [1, *a*] and  $B_i$  are uniformly distributed on [0, *b*]. If the data are  $X_1 = 1.3$ ,  $X_2 = 1.9$ ,  $X_3 = 2.3$  and  $X_4 = 3.4$ , find the maximum relative likelihood function for *a*.

#### Question

We roll a die 100 times, and get 18 sixes. In another experiment, we roll the same die 100 times and get 19 fives. Use the normal approximation to find a 10% likelihood region for the probabilities of rolling a six and of rolling a five.

# A Dose-Response Example

## Question

The probability of a response to a given dose *d* of drug is given by  $\Phi(\alpha + \beta d)$ , for some  $\alpha$  and  $\beta$ .

The number of subjects receiving each dose, and the number of responses is given in the following table:

| dose                | 0.3 | 0.6 |
|---------------------|-----|-----|
| number              | 19  | 20  |
| number of responses | 4   | 12  |

(a) Calculate the maximum likelihood estimate of  $\alpha$  and  $\beta$ . (b) Estimate the ED50 (That is, the dose that would produce a response rate of 50%).

A (10) A (10)

# A Dose-Response Example

### Question

The probability of a response to a given dose *d* of drug is given by  $1 - \frac{1}{2}$  for some *c* and *d* 

 $1 - \frac{1}{1 + e^{\alpha + \beta d}}$ , for some  $\alpha$  and  $\beta$ .

The number of subjects receiving each dose, and the number of responses is given in the following table:

| dose                | 0.1 | 0.3 | 0.4 | 0.5 | 0.6 | 1  |
|---------------------|-----|-----|-----|-----|-----|----|
| number              | 20  | 19  | 21  | 23  | 20  | 19 |
| number of responses | 2   | 4   | 8   | 13  | 12  | 17 |

(a) Calculate the maximum likelihood estimate of  $\alpha$  and  $\beta$ .

(b) Estimate the ED50 (That is, the dose that would produce a response rate of 50%).

# **Chi-Square Approximation**

### Question

A coin has probability p of landing on heads. If we toss the coin n times, using the Chi-Square approximation, what is the probability that the true value of p lies within a 10% likelihood interval?

A > + = + + =

# **Chi-Square Approximation**

#### Question

The lifetime of a light-bulb is thought to be exponentially distributed with parameter  $\lambda$ . 1000 light bulbs are left on for 24 hours. If the true value of the parameter is  $\lambda_0$ , what is the probability that  $\lambda_0$  is in a 10% likelihood interval? What do we get if we use the Chi-Squared approximation?

## **Confidence Intervals**

### Question

A team of ecologists wants to know how many of a certain species of birds lives in a forest. They perform the following experiment: They capture a group of birds and mark them. They then release the birds, and capture more birds a week later, and count how many of those are marked.

Suppose the first group captured (and marked) contains 124 birds, and the second group contains 138 birds, of which 17 are marked. Find a 95% confidence interval for the number of birds in the forest.

★ ∃ > < ∃ >

# **Confidence Intervals**

## Question

Recall the two techniques for finding the answer to a sensitive question:

- Ask the participant to roll an die (out of sight) and if it is 6, answer "YES" regardless of the true answer.
- Ask the participant to roll an die (out of sight) and if it is 6, give the opposite of the true answer.

Which gives a smaller confidence interval for our final estimate of the number of people who should answer "YES"?

## **Confidence Intervals**

### Question

Let  $X_1, \ldots, X_n$  be samples from a normal distribution with mean  $\mu$  and variance 1. Find a 95% confidence interval for  $\mu$ .

伺 ト イ ヨ ト イ ヨ

## **Results for Two-Parameter Models**

#### Question

Let  $X_1, \ldots, X_n$  be independent samples from a normal distribution with mean  $\mu$  and variance  $\sigma^2$ . (a) Find a 95% confidence region for  $\mu$  and  $\sigma^2$ . (b) Find a 95% confidence region for  $\mu$ .

## Question

The probability of a response to a given dose *d* of drug is given by  $\Phi(\alpha + \beta d)$ , for some  $\alpha$  and  $\beta$ .

The number of subjects receiving each dose, and the number of responses is given in the following table:

| dose                | 0.3 | 0.6 |
|---------------------|-----|-----|
| number              | 19  | 20  |
| number of responses | 4   | 12  |

Use a normal approximation to find a 95% confidence interval for the ED50 (the dose that produces a response rate of 50%).

# Expected Information and Planning Experiments

### Question

A team of ecologists is performing a capture-recapture experiment to estimate the total number of birds in a forest. They have enough resources to capture a total of 500 birds in both parts of the experiment. How many birds should they capture and mark, and how many should they recapture, in order to maximise the expected information?

< 回 > < 三 > < 三 >

# Expected Information and Planning Experiments

### Question

We wish to find the parameter  $\lambda$  from an exponential distribution, which measures the lifetimes of light bulbs. One experiment is to observe the lifetimes of *n* lightbulbs  $X_1, \ldots, X_n$ . Another experiment is to censor after the first *m* have broken. That is, to observe the lifetimes until *m* lightbulbs have expired. What is the relative efficiency of the second experiment?

## Bias

## Question

A collection of light bulbs have lifetime following an exponential distribution with parameter  $\lambda$ . We leave 1000 light bulbs on until 10 have failed. Let  $\hat{\lambda}$  be the maximum likelihood estimate of  $\lambda$ , based on these data.

(a) Calculate the bias of  $\hat{\lambda}$  as an estimator for  $\lambda$ .

(b) By invariance,  $\frac{1}{\lambda}$  is the maximum likelihood estimator for the mean lifetime of a light bulb. Calculate the bias of this estimator.

Let  $X_1, \ldots, X_n$  be samples from a normal distribution with mean  $\mu$  and variance  $\sigma^2$ . Test the hypothesis that  $\mu = 0$ .

A (10) A (10) A (10)

### Question

Two companies make light bulbs. The lifetime of a light bulb from company *i* is thought to be exponentially distributed with parameter  $\lambda_i$ . Let  $X_1, \ldots, X_n$  be the lifetimes of a random sample of light bulbs from company 1, and let  $Y_1, \ldots, Y_m$  be the lifetimes of a random sample of light bulbs from company 2. Test the hypothesis that  $\lambda_1 = \lambda_2$ .

## Tests for Binomial Probabilities

### Question

Let  $X_1, \ldots, X_k$  be samples from binomial distributions with parameters  $n_i, p_1$ . Test the hypothesis that  $p_1 = p_2 = \cdots = p_k$ .

A (10) > A (10) > A (10)

## Question

To test the relative effectiveness of two different drugs for an illness, each drug was given to 100 patients. Another 100 patients were given a placebo. The results are given in the following table:

|                | Drug A | Drug B | Placebo |
|----------------|--------|--------|---------|
| Improvement    | 33     | 29     | 24      |
| No improvement | 67     | 71     | 76      |

Test the following hypotheses:

(a) All three treatments have the same probability of improvement.

(b) Drugs A and B have the same probability of improvement.

(c) Assuming that A and B have the same probability of improvement, test the hypothesis that this is the same as the placebo.

(d) Drug A has the same probability of improvement as the placebo.

## Question

Benford's law states that the distribution of the leading digit in a data set is given by  $p(D = k) = \log_{10}(k + 1) - \log_{10}(k)$  for k = 1, ..., 9. The leading digits from a number of important physical constants http:

//physics.nist.gov/cuu/Constants/Table/allascii.txt
are summarised in the table below:

| Digit     | 1   | 2  | 3  | 4  | 5  | 6  | 7  | 8  | 9  |
|-----------|-----|----|----|----|----|----|----|----|----|
| Frequency | 114 | 64 | 30 | 28 | 28 | 24 | 11 | 17 | 18 |

Test the hypothesis that these values follow Benford's law.

(B)

# Tests for Multinomial Probabilities

### Question

The novel *Sanditon* was unfinished when Jane Austen died. A fan finished the novel in an attempt to emulate the style of Jane Austen. Here are the counts of common word usage.

| Word    | Austen      | Imitator   |
|---------|-------------|------------|
| а       | 434 (433.5) | 83 (83.52) |
| an      | 62 (76.3)   | 29 (14.73) |
| this    | 86 (84.7)   | 15 (16.31) |
| that    | 236 (216.3) | 22 (41.79) |
| with    | 161 (171.0) | 43 (33.00) |
| without | 38 (35.2)   | 4 (6.85)   |
| Total   | 1017        | 196        |

Test whether the relative frequencies of these words are consistent between Austen and the imitator.

## Tests for Independence in Contingency Tables

#### Question

The admissions for a university are summarised in the following table:

|        | Admitted | Rejected | Total  |
|--------|----------|----------|--------|
| Male   | 6,843    | 4,921    | 11,764 |
| Female | 3,231    | 2,855    | 6,086  |
| Total  | 10,074   | 7,776    |        |

Test the hypothesis that admission probability is independent of sex.

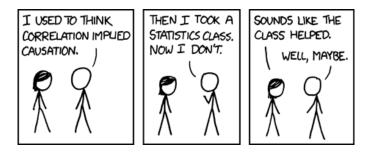

### Question

A study is attempting to determine the effects of speed cameras on location. The study picks 100 locations with speed cameras, and 100 relations without speed cameras. It records whether there is an accident at each location on each of 100 days. The results are summarised in the following table:

|             | Speed Camera | No Speed Camera | Total  |
|-------------|--------------|-----------------|--------|
| Accident    | 1,316        | 921             | 2,237  |
| No Accident | 8,684        | 9,079           | 17,763 |
| Total       | 10,000       | 10,000          |        |

Is there any association between speed cameras, and the probability of accidents?

## Cause and Effect

## Cause and Effect

### Question

The admissions for a university are summarised in the following table:

|        | Subject A Su |        | t A Subject B |        | Subject C |        | Total  |
|--------|--------------|--------|---------------|--------|-----------|--------|--------|
|        | Admit        | Reject | Admit         | Reject | Admit     | Reject |        |
| Male   | 932          | 1,421  | 2,232         | 2,351  | 3,679     | 1,149  | 11,764 |
| Female | 1,564        | 1,951  | 996           | 755    | 671       | 149    | 6,086  |
| Total  | 2,498        | 3,372  | 3,228         | 3,106  | 4,350     | 1,298  |        |

Test the hypothesis that admission probability for each subject is independent of sex.

# Testing for Marginal Homogeneity

### Question

A university is testing to ensure all its courses are the same level of difficulty. Here are the results of 153 students who took a particular two courses:

|                 | Passed course A | Failed course A | Total |
|-----------------|-----------------|-----------------|-------|
| Passed course B | 101             | 19              | 120   |
| Failed course B | 7               | 26              | 33    |
| Total           | 108             | 45              |       |

Test the hypothesis that the courses are equally difficult, i.e. the probability of a student passing each course is the same.

# Testing for Marginal Homogeneity

### Question

We break the results from the last question further:

|          |         | Course A |      |      | Total |
|----------|---------|----------|------|------|-------|
|          |         | A grade  | Pass | Fail |       |
| Course B | A grade | 11       | 8    | 1    | 20    |
|          | Pass    | 2        | 80   | 18   | 100   |
|          | Fail    | 0        | 7    | 26   | 33    |
| Total    |         | 13       | 95   | 45   |       |

Test the hypothesis that the courses are equally difficult, i.e. the probability of each result is the same for each course.

### Question

A team of ecologists wants to know how many of a certain species of birds lives in a forest. They perform the following experiment: They capture a group of birds and mark them. They then release the birds, and capture more birds a week later, and count how many of those are marked.

Suppose the first group captured (and marked) contains 124 birds, and the second group contains 138 birds, of which 17 are marked. Find a 5% significance region for the number of birds in the forest based on a likelihood ratio statistic.

# Significance Regions

#### Question

You are conducting a survey. One of the questions is potentially sensitive — the answer "YES" might be embarassing. To avoid embarrassment, you ask the participant to roll an die (out of sight) and if it is 6, answer "YES" regardless of the true answer. You survey 250 people, and 54 answer yes. Find a 10% significance region for the probability that the true answer for a randomly chosen person is "YES", using the absolute difference between the observed and expected number of "YES" answers as a test statistic.

# Significance Regions

### Question

Let  $X_1, \ldots, X_n$  be independent samples from a normal distribution with mean  $\mu$  and variance 1. Find a 5% significance region for  $\mu$ , using  $\overline{X} - \mu$  as a test statistic. (A one-sided region).

< 回 > < 三 > < 三 >

# Significance Regions

### Question

Let  $X_1, \ldots, X_{100}$  be independent samples from an exponential distribution. Find a 5% significance region for  $\lambda$  using  $|\lambda - \hat{\lambda}|$  as a test statistic.

イロン イヨン イヨン イヨ

#### Question

Let  $X_1, \ldots, X_n$  be samples from an exponential distribution with parameter  $\lambda$ . Show that  $X_1 + \cdots + X_n$  is a sufficient statistic for  $\lambda$ .

< 回 > < 三 > < 三 >

#### Question

Let  $X_1, \ldots, X_n$  be samples from a uniform distribution on the interval [0, a]. Show that  $\max(X_1, \ldots, X_n)$  is a sufficient statistic for *a*.

#### Question

Let  $X_1, \ldots, X_n$  be samples from an exponential distribution with parameter  $\lambda$ . However, the values may be subject to censorship. Show that  $X_1 + \cdots + X_n$  and the number of samples *M* that were censored are a minimally sufficient pair of statistics for  $\lambda$ .

### Question

Let  $X_1, \ldots, X_n$  be independent samples from a normal distribution with mean  $\mu$  and variance  $\sigma^2$ . Show that  $X_1 + \cdots + X_n$  and  $X_1^2 + \cdots + X_n^2$  are a pair of sufficient statistics for  $\mu$  and  $\sigma$ .

A B b 4 B b

#### Property 1

If *T* is sufficient for  $\theta$ , then the likelihood function of  $\theta$  given the observed value of *T* is proportional to  $L(\theta; y)$ .

イロト イポト イヨト イヨ

#### Property 2

If T is sufficient for  $\theta$ , then the conditional distribution of y given the observed value of T does not depend on  $\theta$ .

#### **Property 3**

If  $U_1, \ldots, U_k$  is a one-to-one transformation of  $T_1, \ldots, T_k$ , then  $T_1, \ldots, T_k$  is sufficient for  $\theta$  if and only if  $U_1, \ldots, U_k$  is.

イロト イヨト イヨト イヨト

#### Property 4

The maximum likelihood estimate  $\hat{\theta}$  can be computed from any set of sufficient statistics.

A .

### Question

Let  $X_1, \ldots, X_n$  be independent samples from an exponential distribution with parameter  $\lambda$ . Suppose we have  $\hat{\lambda} = 0.4$ . Find the exact significance level for the hypothesis  $\lambda = 1$  using a likelihood ratio test, and compare it to the chi-squared approximation.

### Question

Let  $X_1, \ldots, X_n$  be independent samples from a normal distribution with mean  $\mu$  and variance  $\sigma^2$ . Calculate an exact significance level for testing the hypothesis  $\mu = 0$ .

### Question

Suppose  $X_1, \ldots, X_n$  are believed to be independent samples from a Poisson distribution with parameter  $\lambda$ , but censored at 2 (that is, values are either 0, 1, or "at least 2"). We have the following frequencies:

| Value     | 0   | 1   | ≥2 |
|-----------|-----|-----|----|
| Frequency | 642 | 134 | 24 |

What is the exact significance level of a conditional likelihood ratio test for whether the censored Poisson distribution is appropriate?

# Some Examples of Conditional Tests

### Question

Consider the following data from a study on speed cameras:

|             | Speed Camera | No Speed Camera | Total |
|-------------|--------------|-----------------|-------|
| Accident    | 31           | 21              | 52    |
| No Accident | 69           | 79              | 148   |
| Total       | 100          | 100             | 200   |

Perform an exact conditional test to determine the significance level of this data for testing the independence of speed cameras and accidents.
