

ACSC/STAT 3720, Life Contingencies I

Winter 2017

Toby Kenney

Homework Sheet 6

Due: Friday 24th March: 12:30 PM

Basic Questions

1. An insurer issues 3,000 whole life insurance policies to standard lives aged 45. The appropriate interest rate is $i = 0.06$. The company calculates $A_{45} = 0.0832768$ and ${}^2A_{45} = 0.0167276$. If the death benefit is \$900,000, what annual premium should the company charge using the portfolio percentile method with a 95% probability of making a profit?
2. Using the lifetable in Table 1, and interest rate $i = 0.05$, calculate the net annual premium for a 5-year endowment insurance policy with benefit \$350,000, sold to a standard life aged 44, if:
 - (a) The life works in a hazardous environment, and has mortality 0.012 higher than normal.
 - (b) The life is an impaired life, and is treated as a life five years older than its actual age.
3. An insurance company has a whole life insurance policy for an individual aged 52. The death benefit of this policy is \$800,000, and the interest rate is $i = 0.06$. Premiums are payable until age 80. The insurance company calculates $A_{52} = 0.118287$, and $A_{80} = 0.400802$. Therefore, the net annual premium for the policy is \$6,852.85. What is the policy value if the life survives to age 60? [Use the ultimate part of the lifetable in Table 1.]
 - (a) Using the same basis as the premium basis, which gives $A_{60} = 0.173662$.
 - (b) Using the reserve basis $i = 0.04$, which gives $A_{80} = 0.526062$, $A_{60} = 0.28965$, $A_{52} = 0.220514$, $\ddot{a}_{80} = 12.32239$, $\ddot{a}_{60} = 18.46910$ and $\ddot{a}_{52} = 20.26664$.

Standard Questions

4. A life insurance company sells 5-year term insurance policies to lives aged 34 for whom the Ultimate part of the lifetable in Table 1 is appropriate. The death benefit is \$600,000. The interest rate is $i = 0.04$. This gives $A_{34} = 0.115052$ and $A_{39} = 0.138327$, and also ${}^2A_{34} = 0.0211068$ and ${}^2A_{39} = 0.0292477$. Using the portfolio premium principle with a 95% probability of profit, they calculate a premium of \$360.62. How many policies are they including in the portfolio?
5. A select life aged 39 takes out a whole life insurance with benefit \$600,000. The initial cost of this insurance is \$2,000 plus 20% of the first annual premium. The renewal cost is 3% of each subsequent premium. The interest rate is $i = 0.05$. Using the lifetable in Table 1, we can calculate $A_{42} = 0.103456$.
 - (a) Calculate the gross premium for this policy.
 - (b) Calculate the gross policy value after 2 years.

Table 1: Select lifetable to be used for questions on this assignment
